PRODUCT GROWTH ASSIGNMENT

Korean Marine Collagen PDP: A CRO Breakdown

This document examines the Wellbeing Nutrition Korean Marine Collagen product page through a conversion lens — identifying where the existing page loses buyer confidence, proposing targeted experiments, and explaining the rationale behind the redesigned shopping experience.

Brand: **Wellbeing Nutrition**
Product: **Korean Marine Collagen (200g)**
Price: **~₹1,529**
Focus: **PDP Conversion Optimization**

This analysis is based on a qualitative review of the live product page without access to real analytics, heatmaps, session recordings, or customer interviews. Funnel estimates and benchmark ranges are illustrative. All recommendations are hypotheses to be validated through testing.

THREE HIGHEST-IMPACT CHANGES

1. **Rewrite the headline to lead with outcomes.** The current title reads like a search string. Buyers need to immediately understand what the product does for them.
2. **Surface the results timeline above the fold.** "When will I see results?" is the top buyer question, but the answer is buried in the FAQ section.
3. **Add trust signals directly below the price.** Trust badges at the purchase decision point reduce hesitation where it matters most.

SECTION 01

Problem Framing & Buyer Context

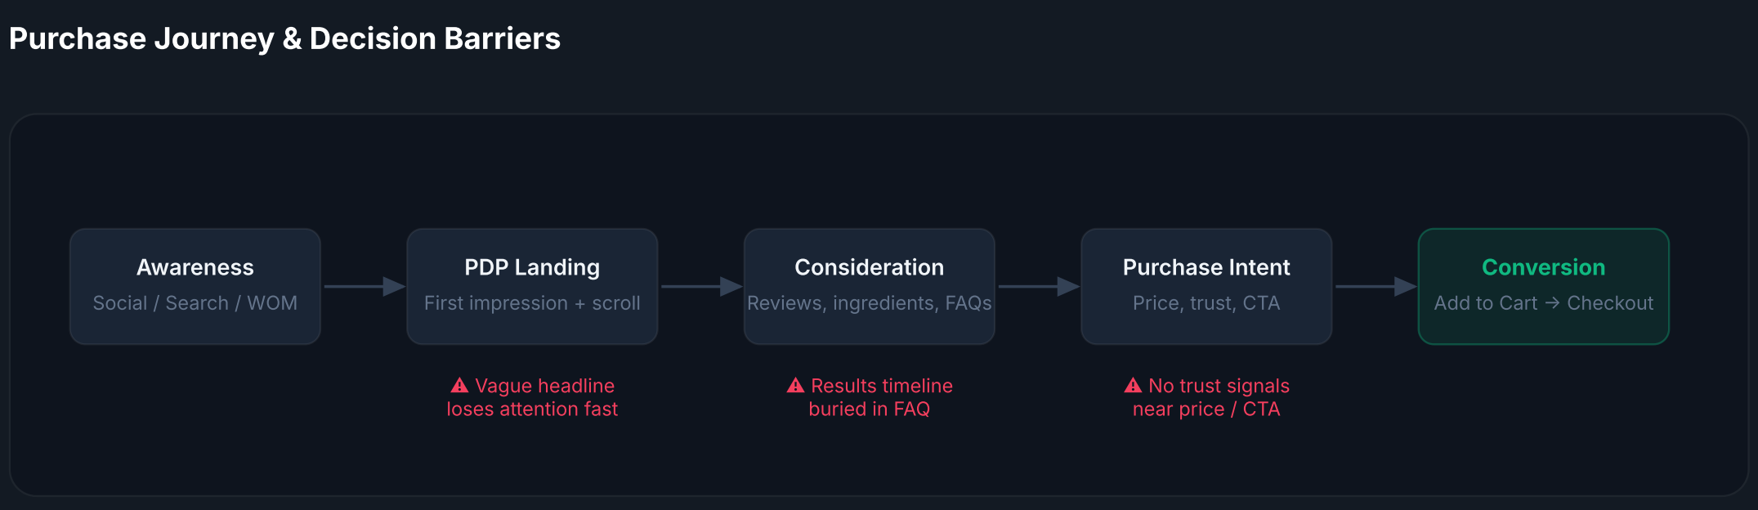
A ₹1,529 wellness supplement is not an impulse buy. The potential customer has already done some research, is aware of collagen as a category, and is evaluating Wellbeing Nutrition against alternatives (OZiva, HK Vitals, Kapiva). The product page is likely the primary decision environment — and it needs to do the job that a knowledgeable sales assistant would do in a store.

Likely Buyer Segments

SEGMENT	PRIMARY MOTIVATION	KEY PURCHASE QUESTION	RISK OF ABANDONMENT
Skin-focused buyer (25–40, urban)	Reduce fine lines, dullness, or uneven texture after seeing peer recommendations or social content	"Will this actually work for my skin type? When will I see a difference?"	High — outcome uncertainty drives tab-switching to reviews and alternatives
Hair-fall researcher (28–45)	Supplement collagen for hair density after reading that it supports keratin production	"Is marine collagen better than biotin or plant-based options? Is the source clean?"	Medium — more ingredient-literate, wants sourcing specifics
Wellness-stack buyer (30–45)	Filling a perceived nutritional gap; already takes other supplements	"Can this be mixed with other things? Does it actually absorb well?"	Lower — more likely to convert if formulation is credibly presented
Gift buyer (any age)	Buying for a family member or friend; trusts the WBN brand	"Is this the right product for them? What are realistic expectations?"	Medium — less skeptical but needs clear communication of what the product is

Segment definitions above are based on general D2C supplement buyer research patterns and the product's positioning. They are assumptions — persona validation through actual customer interviews or behavioral data would sharpen these considerably.

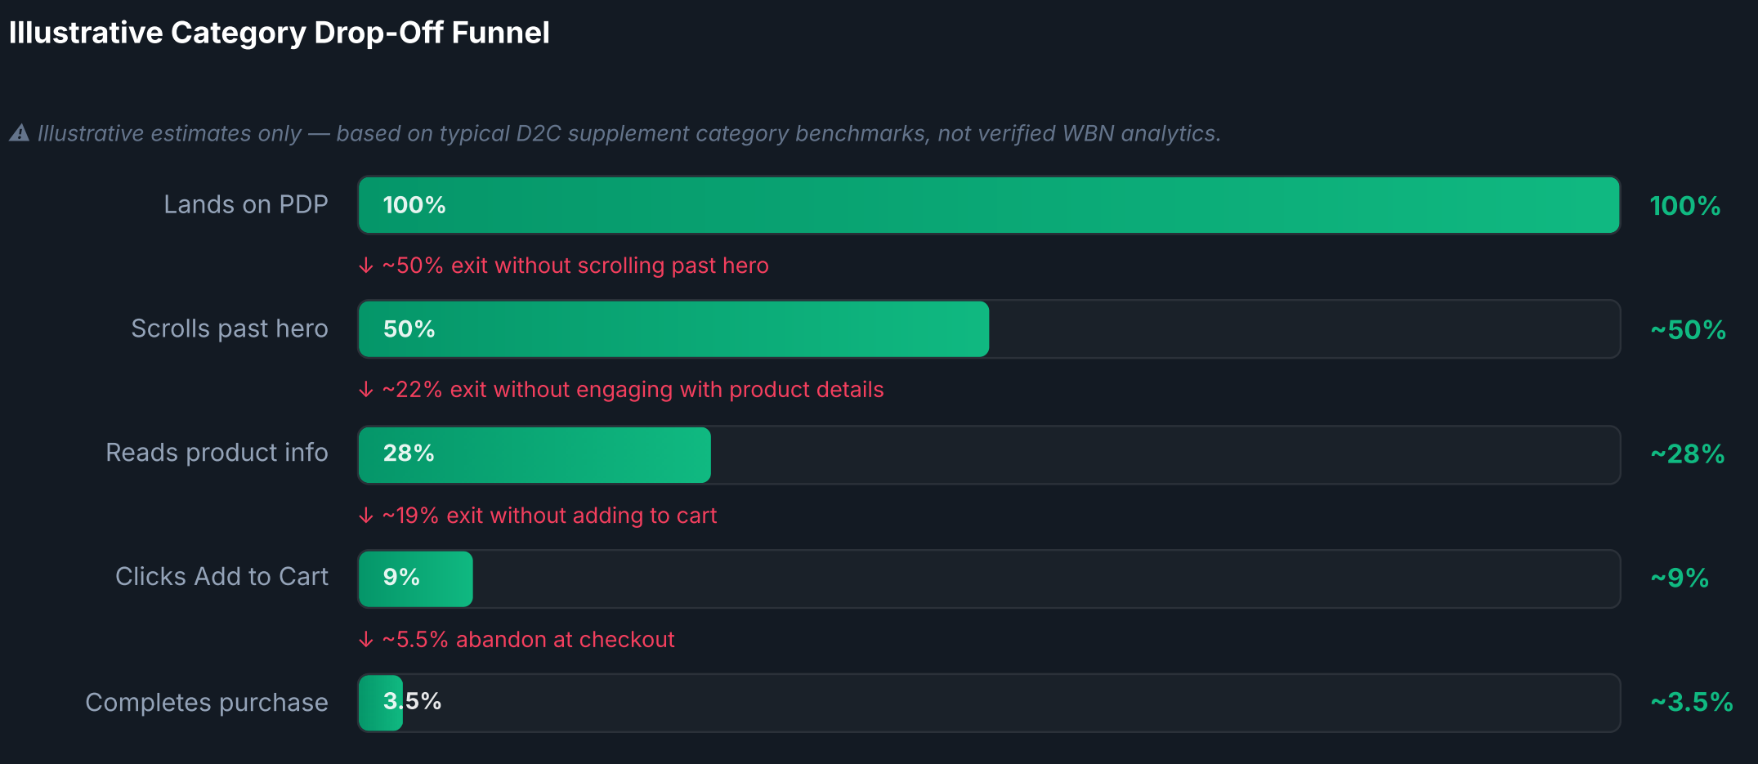
Purchase Journey & Decision Barriers



Awareness
Social / Search / WOM
PDP Landing
First impression + scroll
Consideration
Reviews, ingredients, FAQs
Purchase Intent
Price, trust, CTA
Conversion
Add to Cart → Checkout
⚠ Vague headline loses attention fast
⚠ Results timeline buried in FAQ
⚠ No trust signals near price / CTA

Illustrative Category Drop-Off Funnel

⚠ *Illustrative estimates only — based on typical D2C supplement category benchmarks, not verified WBN analytics.*



SECTION 02

Existing PDP Audit

I reviewed the live product page at wellbeingnutrition.com like a potential buyer would — reading copy, checking information hierarchy, and noting what required additional effort to find. The audit below covers what is working, what is creating friction, and why each item matters for conversion.

What the Page Already Does Well

Strong Ingredient Story WORKING

Deep-sea Korean fish sourcing, nano-hydrolyzed peptides (<1000 Daltons), and lab-testing claims are genuine differentiators. The information exists — it just needs earlier and more prominent placement in the page hierarchy.

Product Photography WORKING

The product images on the live page are clean and well-lit. Multiple images show the packaging from different angles, which gives buyers sufficient visual confidence about what they are purchasing.

Clear Dosage Instructions WORKING

How-to-use information is present. Daily dosage (5–10g), mixing instructions, and timing guidance are included — reducing post-purchase uncertainty for buyers who make it that far.

Comprehensive FAQ WORKING

The FAQ section is detailed and covers the most common buyer objections — vegetarian status, weight gain, mixing with hot drinks, comparison with bovine collagen, and results timeline. The content is good; placement is the issue.

Friction Points and Information Hierarchy Issues

Keyword-Dump Headline HIGH IMPACT

The current title — "Pure Korean Marine Collagen Peptides | Unflavored | Combat Signs of Ageing" — reads like an SEO string, not a product benefit statement. It names chemical specs and format rather than communicating what changes for the buyer. Buyers are scanning for relevance in under 3 seconds.

Results Timeline Buried in FAQ HIGH IMPACT

"When will I see results?" is almost certainly the #1 buyer question in this category. The answer ("4–8 weeks") is accurate and stated in the FAQ — but requiring a buyer to scroll to the bottom and open an accordion to find it creates unnecessary uncertainty during the consideration phase.

No Trust Signals at Decision Point HIGH IMPACT

The price and Add-to-Cart button area has no surrounding reassurance messaging. Key information — lab tested, deep-sea sourced, money-back policy — appears either much higher on the page or not at all near the primary CTA. Conversion decisions are made at the point of maximum risk perception.

No Subscription or Repeat-Order Option REVENUE LEAK

Collagen is a daily-use supplement with a 4–12 week efficacy window, meaning repeat purchases are the natural product behavior. The absence of a subscribe-and-save or bundle option near the purchase controls leaves potential LTV gains unaddressed.

Mobile CTA Scroll Distance MOBILE ISSUE

On mobile, reaching the Add-to-Cart button after reading even two sections of content requires significant scroll. A sticky or floating CTA bar on mobile would reduce friction for buyers who are ready to purchase mid-scroll.

Unanchored Social Proof TRUST GAP

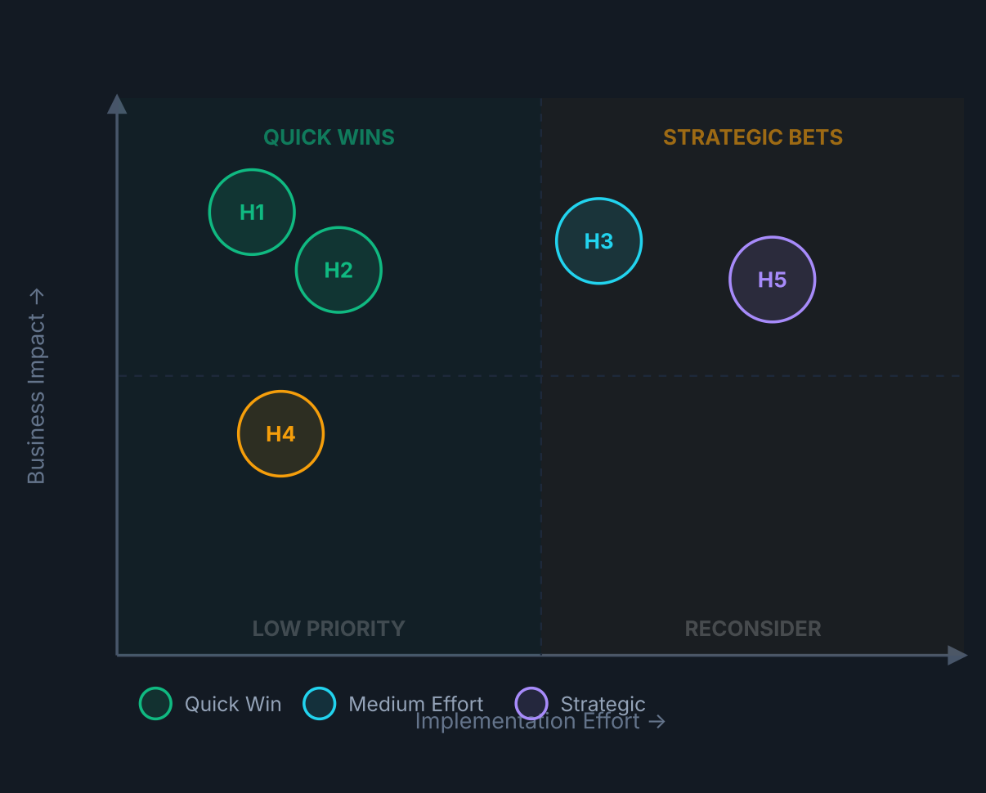
Reviews appear to exist, but the review system (Judge.me) loads asynchronously. During the critical first few seconds, there is no visible star rating or review summary in the hero section — the part of the page that buyers see first.

SECTION 03

Prioritized CRO Opportunities

Each opportunity below maps a specific user problem to a proposed intervention, with an assessment of effort and expected direction of impact. Specific percentage lift predictions are excluded — without baseline data, any numbers would be fabricated.

Effort vs. Impact Overview



Opportunity H1 QUICK WIN PRIORITY: HIGH

Rewrite the product headline to lead with buyer outcome

USER PROBLEM
Buyers scanning the page don't see an immediate answer to "what does this do for me?" The current title names the product format, not the benefit.

PROPOSED CHANGE
Replace title with an outcome-first headline (e.g., *"Firmer Skin & Stronger Hair. In 8 Weeks."*), with the technical product name as a sub-label.

BEHAVIORAL RATIONALE
Processing fluency principle: buyers make faster, more confident decisions when they can immediately map a product to a desired outcome.

PRIMARY SUCCESS METRIC
Add-to-Cart rate (ATC%) — secondary: scroll depth past hero section.

Opportunity H2 QUICK WIN PRIORITY: HIGH

Place trust signals directly below the price and CTA

USER PROBLEM
At the moment of maximum decision anxiety (price + buy button), there is no reassurance. Key differentiators are scattered elsewhere.

PROPOSED CHANGE
Add 4–5 compact trust indicators directly below the ATC button: lab-tested, deep-sea sourced, Dalton size, money-back policy, return terms.

BEHAVIORAL RATIONALE
Risk-reduction at the point of decision. The closer reassurance messaging is to the buy action, the more effective it is at reducing abandonment.

PRIMARY SUCCESS METRIC
ATC-to-checkout rate (measures drop-off between cart addition and checkout initiation).

Opportunity H3 MEDIUM EFFORT PRIORITY: HIGH

Add a visual "What to Expect" results timeline above the fold

USER PROBLEM
The #1 anxiety with collagen is uncertainty about when it works. This information is buried in FAQ and requires scrolling and clicking to access.

PROPOSED CHANGE
A 4-step visual progression (Week 2 → Week 4 → Week 8 → Week 12) showing expected changes at each stage, placed in the hero or just below it.

BEHAVIORAL RATIONALE
Reduces ambiguity and sets honest expectations — both of which increase purchase commitment and reduce return rates. Anchors the buyer's mental model before they open competing tabs.

PRIMARY SUCCESS METRIC
Time-on-page, CTA engagement rate, and return rate as a guardrail.

Opportunity H4 QUICK WIN PRIORITY: MEDIUM

Implement a sticky purchase bar on mobile

USER PROBLEM
On mobile, buyers who are ready to purchase mid-scroll have to scroll back up or all the way down to find the Add-to-Cart button.

PROPOSED CHANGE
A compact bottom bar on mobile (visible after user scrolls past the hero) showing product name, price, and an ATC button.

BEHAVIORAL RATIONALE
Reduces conversion friction at peak intent moments — buyer doesn't need to navigate to act on their decision.

PRIMARY SUCCESS METRIC
Mobile ATC rate specifically. Guardrail: layout shift / usability feedback.

Opportunity H5 STRUCTURAL PRIORITY: MEDIUM (LONG-TERM)

Introduce a Subscribe & Save purchase option

USER PROBLEM
The product is a daily-use supplement with a minimum 8-week commitment for visible results. No repeat-purchase option is offered, which misses LTV potential and makes a two-bottle purchase feel like a large upfront commitment.

PROPOSED CHANGE
Add a two-option radio selector above ATC: "One-time purchase (₹1,529)" and "Subscribe monthly + save" — pending product team validation of feasibility and discount structure.

BEHAVIORAL RATIONALE
Subscription anchoring reduces perceived per-unit cost, aligns with natural product usage cycle, and improves LTV without needing to acquire new customers.

PRIMARY SUCCESS METRIC
Subscription adoption rate, 90-day revenue per customer. Requires backend integration and product team input before testing.

SECTION 04

Redesigned PDP — Strategy & Rationale

The redesigned product page (see `enhanced-pdp.html`) preserves the core content and brand identity while restructuring the information hierarchy to address the friction points identified above. Each major design decision is mapped to a specific user problem.

1. Outcome-first headline

The redesigned page opens with *"Firmer Skin & Stronger Hair. In 8 Weeks."* as the primary heading. Technical specs (Type I & III collagen, nano-hydrolyzed) appear in the first line below. This addresses H1 directly.

2. Trust pills in the hero

Compact trust indicators (deep-sea sourced, lab-tested, unflavored, keto-friendly) are placed directly below the product name in a pill-row format. They are visible before the buyer scrolls, answering basic source and safety questions upfront.

3. Results timeline as a dedicated section

A 4-step visual timeline (Weeks 2 → 4 → 8 → 12) surfaces the expected progression clearly and early in the page. This answers the #1 buyer question before they bounce to research elsewhere. Language is careful: "many users notice" rather than guaranteed outcomes.

4. Purchase-option selector

A two-option radio UI presents one-time purchase vs. a suggested subscription option. This is labeled as a design proposal, with prices marked as illustrative pending business model validation.

5. Sticky mobile ATC bar

A fixed bottom bar appears on mobile once the user scrolls past the product hero. It shows the product name, price, and an Add-to-Cart button — keeping the purchase action accessible regardless of scroll position.

6. Science section with qualified claims

The bioavailability claim is framed as "higher bioavailability versus standard collagen" rather than asserting a specific multiplier. The science section focuses on the mechanism (smaller peptide size, better gut absorption) rather than unverified clinical outcomes.

⚠ The redesigned page uses **actual product images from the Wellbeing Nutrition CDN** for the gallery. Review content and rating data in the redesigned page are explicitly labeled as illustrative. Prices and subscription details are design proposals, not confirmed business decisions.

SECTION 05

Experiment Plan

Prioritized experiments for the first two testing cycles. Each is framed as a testable hypothesis with explicit control vs. treatment, primary metric, and guardrails. All experiments require baseline data to run properly and should only be run once adequate tracking is confirmed.

Experiment 01 — H1 A/B TEST START HERE

Headline Rewrite: Outcome-First vs. Current

HYPOTHESIS
If we change the product headline to lead with a customer outcome, buyers will more quickly understand the product's relevance to their needs, leading to higher engagement and ATC rate.

CONTROL
"Pure Korean Marine Collagen Peptides | Unflavored | Combat Signs of Ageing" (current title)

TREATMENT
"Firmer Skin & Stronger Hair. In 8 Weeks." with product spec as a subtitle line.

PRIMARY METRIC
Add-to-Cart click rate (measured at session level)

GUARDRAIL METRICS
Time on page (should not decrease significantly); bounce rate; return rate (ensure copy sets honest expectations)

REQUIRED TRACKING
GA4 with ATC event, scroll depth events (25%, 50%, 75%), and session recording tool (Clarity or Hotjar)

DECISION CRITERIA
Run until statistical significance at 95% confidence or minimum 2 weeks (whichever is later). Declare winner if treatment shows a directional lift in ATC rate without meaningful deterioration in guardrails.

Experiment 02 — H2 A/B TEST FAST CYCLE

Trust Badges Below Price: Present vs. Absent

HYPOTHESIS
Adding visual trust signals (lab-tested, deep-sea sourced, return policy) immediately below the price will reduce purchase anxiety and increase ATC-to-checkout conversion.

CONTROL
Current layout: price block followed immediately by quantity selector and ATC button with no surrounding reassurance.

TREATMENT
Same layout with a compact row of 4 trust icons (with short labels) placed between the price and the ATC button.

PRIMARY METRIC
ATC-to-checkout initiation rate

GUARDRAIL METRICS
Overall session duration; ATC rate (should not be harmed by added content in the area)

REQUIRED TRACKING
Checkout funnel events, cart abandonment events

DECISION CRITERIA
Minimum 2 weeks of data, 95% confidence. This test should run after Experiment 01 or in parallel on different page variants to avoid confounds.

Experiment 03 — H3 A/B TEST SECOND CYCLE

Results Timeline Placement: In-Page Section vs. FAQ Only

HYPOTHESIS
Surfacing a visual "what to expect" timeline as a dedicated section above the FAQ — rather than only inside an FAQ accordion — will reduce buyer uncertainty and increase conversion rate.

CONTROL
Results information accessible only via FAQ accordion at the bottom of the page.

TREATMENT
A new visual timeline section (Weeks 2/4/8/12) added between the product hero and the benefits section.

PRIMARY METRIC
PDP overall conversion rate (sessions → purchase)

GUARDRAIL METRICS
Return and refund rate (ensure expectations set by timeline are accurate); FAQ section engagement rate

REQUIRED TRACKING
Purchase events, refund rate from operations data, section scroll engagement

TESTING CONSIDERATION
This requires modifying page structure. Run after quick-win experiments are confirmed to isolate the effect of the timeline specifically.

SECTION 06

Implementation Roadmap

Sequenced as three phases: instrumentation first (no testing without baseline data), then quick wins that require minimal development, then structural changes that need more coordination.

TIMELINE	ACTIONS	OWNER / NOTE	SUCCESS INDICATOR
PHASE 1 **Weeks 1–2**	Verify GA4 is recording ATC events, scroll depth (25/50/75%), FAQ accordion opens, and checkout steps correctly. Implement Clarity or Hotjar session recording on PDP. Establish 2-week baseline for ATC rate and conversion rate before launching any tests.	Analytics / Dev	Clean, confirmed baseline data visible in dashboard
PHASE 1 **Weeks 3–4**	Launch Experiment 01 (headline rewrite). Simultaneously: implement sticky mobile ATC bar as a standalone non-tested improvement (low code risk, high mobile UX benefit regardless of headline test outcome).	Dev (front-end) + CRO	Experiment 01 live with clean variant split; mobile sticky bar functional
PHASE 2 **Weeks 5–6**	Evaluate Experiment 01. If directional, proceed to implement winner. Launch Experiment 02 (trust badges below price). Begin design & copy work for results timeline section in parallel.	CRO + Design	Experiment 02 live; timeline section design approved
PHASE 2 **Weeks 7–8**	Evaluate Experiment 02. Implement winner. Launch Experiment 03 (results timeline placement). Initiate internal discussion on subscription model feasibility (H5) with product & operations teams.	Dev + Product	Experiment 03 live; subscription feasibility assessment complete
PHASE 3 **Weeks 9–12**	Evaluate Experiment 03. If subscription model approved, design and implement subscribe-and-save toggle (H5). Run iterative tests on secondary elements (review placement, image order, gallery format). Review overall conversion trend against baseline.	Cross-functional	Full experiment cycle complete; overall CVR trend measured against baseline

SECTION 07

Measurement Framework

All targets below are directional goals, not guaranteed outcomes. Specific numbers should be set after reviewing 2-week baseline data, since the right target depends on current performance.

ATC Rate
Primary metric — goal: directional improvement from baseline
Measure at session level, segment by device

CVR
PDP session to purchase conversion rate
Requires purchase event + session attribution in GA4

ATC → Checkout
What % of ATC clicks reach checkout initiation
Identifies drop-off between cart and payment

RPV
Revenue per visitor — captures AOV & CVR together
Best single-number view of PDP commercial performance

Guardrail Metrics

GUARDRAIL	WHY IT MATTERS	ACTION IF VIOLATED
Return & Refund Rate	Copy changes that set unrealistic expectations would drive returns even if they improve initial conversion	Pause test; review copy for overclaiming
Review Rating (if public)	Declining satisfaction signals would undermine the long-term impact of any conversion lift	Investigate source of dissatisfaction before continuing tests
Mobile Usability Score	Sticky ATC bars or layout changes could create layout shift or obscure content on small screens	QA on multiple device types before launch; collect user feedback
Page Load Time	Adding new sections, images, or scripts can degrade Core Web Vitals and hurt both UX and SEO	Monitor LCP & CLS; optimize assets before shipping new sections

SECTION 08

Limitations & Next Steps

This analysis is based on a qualitative review of the product page and general D2C supplement category knowledge. A number of things would materially improve the quality and confidence of these recommendations.

No Access to Real Analytics

All funnel estimates are illustrative benchmarks. The actual ATC rate, scroll depth, device split, and conversion rate for this specific PDP are unknown. Reviewing real GA4 data would immediately surface the biggest drop-off points.

No Heatmap or Session Data

Without Clarity or Hotjar recordings, it's impossible to know precisely where buyers scroll, click, or stop. This would either validate or significantly revise the audit findings above.

No Customer Research

The buyer segments and purchase objections above are assumptions. Even 5 user interviews (or a survey sent to past buyers) would reveal actual objections and make hypothesis prioritization much sharper.

Subscription Model Unverified

H5 (subscribe & save) assumes the business model and operations can support it. This would need product team, finance, and ops input before it can be designed or tested properly.

Mobile Traffic Share Unknown

If the majority of traffic is mobile (common for D2C wellness brands in India), mobile-specific improvements (sticky CTA, image sizing, font scaling) would warrant higher priority than they currently have.

Traffic Volume Constrains Testing

Statistical significance requires sufficient traffic. If the PDP receives fewer than ~10,000 sessions per month, some experiments will take months to reach confidence. Sample size should be estimated before designing tests.

Recommended Immediate Next Steps

- **Confirm tracking setup:** Verify GA4 is capturing ATC, scroll depth, FAQ opens, and checkout steps correctly. This is prerequisite for everything else.
- **Establish a 2-week baseline:** Run no experiments until you have clean baseline data to compare against.
- **Run 3–5 buyer interviews:** Even short calls with recent customers (or survey responses) would validate whether the identified friction points are real.
- **Prioritize mobile audit:** Check the current PDP on Android and iOS at actual device dimensions. Identify any layout or usability issues that don't appear on desktop.
- **Start with headline test:** Experiment 01 requires no backend work, can be run via a testing tool, and directly tests the highest-confidence hypothesis.
